IA10: Individual Contribution and Professional Reflection

Name: Alhassan Abdul Waris · **GitHub:** AbdiWaris · **Video**

My contribution

Field	Detl
What I did	{Describe the ONE most significant thing you personally built or fixed - e.g. "Implemented the checkout token guard in checkout.php to prevent duplicate orders"}
Files changed	{e.g. checkout.php, tests/OrderingTest.php (TC-18)}
Commit SHA(s)	{paste real SHAs from your GitHub history}
PR / issue	{link}
Why it mattered	{how your work unblocked or improved the team}

What I learned

Coming into this project I understood version control in theory but had never used it to coordinate multiple people writing to the same codebase at the same time. Managing the team repository taught me what that actually means in practice. Early in the semester two members pushed directly to mn and overwrote each other's work. After that I introduced the branch-per-feature rule and made sure every change came in through a pull request. By the end of the project no one lost work to a merge conflict.

Running the tests was the part of the project I found most valuable for my own understanding. Before I ran php phpunit.phar

--group regression --nocoverage for the first time I did not really see the difference between a test that documents a known bug and a test that gates a merge. Seeing 24 pass while the 19 known-defect tests were excluded made that distinction concrete. I also learned that a green test run does not mean the software is correct - BUG-07, where cart edits are silently lost on navigation, never caused a test to fl yet it is a real problem for any customer.

The hardest moment was coordinating the client meeting. Getting all members avlable at the same time took days of chasing. If we started agn I would lock in the client meeting date in the first week of the semester rather than wting until the team felt ready, and I would keep shared meeting notes from day one instead of reconstructing them from memory later. Those two habits alone would have saved several hours across the project.

Honest self-assessment

onest self assessment

Dimension	**Score (1-5)**	**Evidence**
Technical contribution	3	Set up dev environment, ran test suite, managed deployment - did not write application feature code directly
Communication in the team	5	Organised all meetings, tracked action items, distributed client interview notes to the tea
System understanding	4	Can trace a request from browser through checkout.php to MySQL and back; understan transaction rollback and token mechanism
Testing / quality mindset	4	Ran regression gate before every merge; identified that known-defect tests must not blo flagged BUG-07 as untested

Professional habits	4	Mntned branch discipline in the team repo; kept meeting records; consistent commits throughout the semester

One thing that would have made the project better

I would have set up the CI pipeline in week one rather than near the end of the project. Having the 24-test regression gate running from the start would have caught broken merges immediately instead of letting them accumulate. The cost would have been one afternoon to configure the GitHub Actions workflow - much less than the time we spent debugging integration problems that a passing test run would have flagged on the day they were introduced.

Section	**used?**	**What did**	**What I did**
IA01	Yes	Drafted typed explanation from checkout.php and test files	Verified each point agnst source; grounded client intervie references; recorded video
IA02	Partial	Drafted question set structure and transformation table	Interview is the real Group 19 Q&A; raw statement and 2 word reflection written by me
IA03	Yes	Drafted use case, story, ACs and traceability row	Verified agnst requirements file; added real issue URL
IA04	Yes	Drafted ADR including matrix and flure walkthrough	Adjusted matrix scores; ran concurrency check; recorded
IA05	Yes	Drafted API contract, error model and test plan	Verified field names and error message strings agnst checkout.php

IA06	Yes	Drafted ERD analysis, query walkthrough and privacy table	Verified FK constrnts agnst brny_bites.sql; recorded video
IA07	Yes	Drafted test overview, defect write-up and new test ideas	Ran php phpunit.phar locally; pasted real output; wrote co reflection myself
IA08	Yes	Drafted three threats and privacy table	Verified each threat agnst source files; recorded video
IA09	Yes	Drafted pipeline analysis and improvements	Verified agnst ci.yml; recorded video
IA10	Partial	Provided structure and self-assessment table	All content - contribution, learning, scores - written by me
